

Game Design

Tuesdays at Robious Elementary School

4:00-5:00pm
1/10 - 2/14

Introduction

- Introduce yourself
- Tell us 2 truths and a lie about yourself
- Instructors
- We'll go over what to expect during the class

Objectives

- ❖ Collaborate with your classmates to design awesome games!
- ❖ We'll learn the **Design Thinking** process
 - A user-centered approach to design games
- ❖ Along the way, we'll learn computer science!

- ❖ **Empathy**: Be able to step in another person's shoes, and see what they see
- ❖ **Define**: Ask questions: What are the user's needs/wants? Issues? Likes/Dislikes?
 - Brainstorm more than one solution to the user's issues
- ❖ **Prototype**: Design a game based on user feedback
- ❖ **Test**: Have your classmates test out your game and give you feedback
- ❖ **REPEAT!!!**

Design Thinking | Empathy/Define

What is your favorite game to play?

Why is this your favorite game?

What makes this game fun?

- ❖ Keep those design thinking questions/answers in mind for when you start to create your games!

Game Design

What we'll use:

❖ Game Building

- Hyperpad (Gamepress)
- Advanced level design
- Advanced characters
- Advanced game play and logic

❖ Design Thinking

- User-centered approach to solve problems and design

❖ Computer Science Concepts

- Along the way we will learn fundamentals of coding

Design Thinking Exercise

Let's Play

- ❖ Open the Hyperpad app
- ❖ Pick 1 game from “Projects”
 - Play a total of 3 games.
- ❖ Play the game — timed 4 minutes for each game.
- ❖ Jot down what you think about the games on your sheet

Think about these things while you play:

- Good things
- Bad things
- What do you want in your game?
- What would you leave out of your game?

Design your game!

1. Set the stage
 - a. Sketch a level-design of your game
 - b. Draw blocks
 - c. Draw obstacles (i.e. spikes, lava, etc.)
2. Game Story
 - a. Is there a background story for your protagonist?
 - b. Is there even a protagonist?
3. **Keep in mind your design thinking statements**

Hyperpad Basics

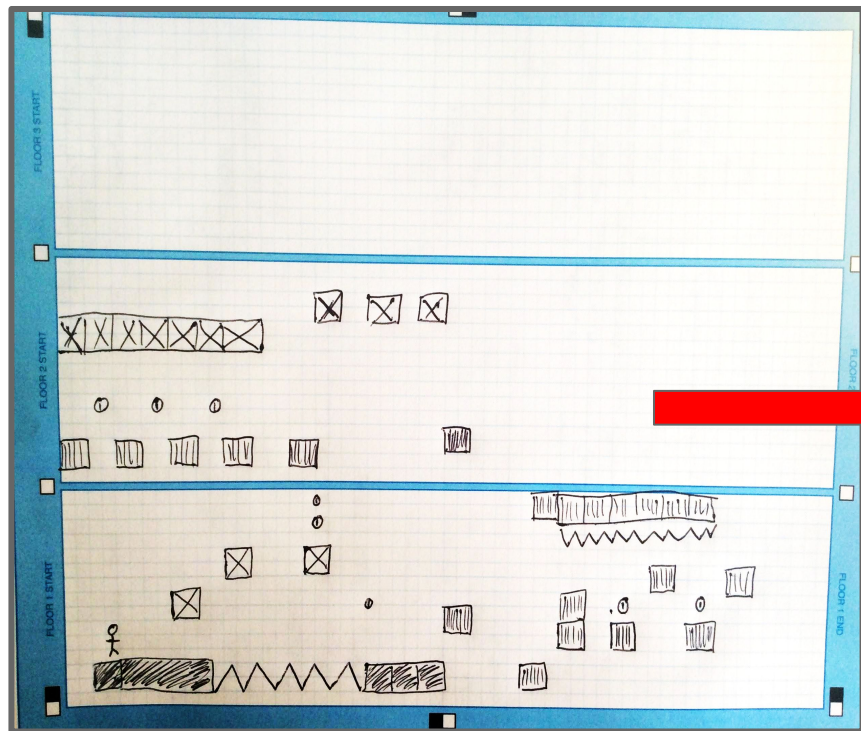

walk-through

*** NOTE ***

- ❖ Everything in Hyperpad is an object
 - Just an object, with no properties... *not for long!*
- ❖ Your character will not automatically know that coins are good and spikes/ lava are bad
 - YOU have to specify what the objects do!
 - The objects will not do anything by themselves
 - YOU are in control!

Example: Paper sketch to Hyperpad

Design your game!

1. Transfer your drawing
 - a. Make a New Project in Hyperpad
 - b. Select Side-View
 - c. Make your drawing of level-design come to life by placing your blocks and obstacles on the Hyperpad game surface

Create a New Project

Tap +New Project

Become A PRO

CREATE

Then tap "create new project"

This is your game's "surface"

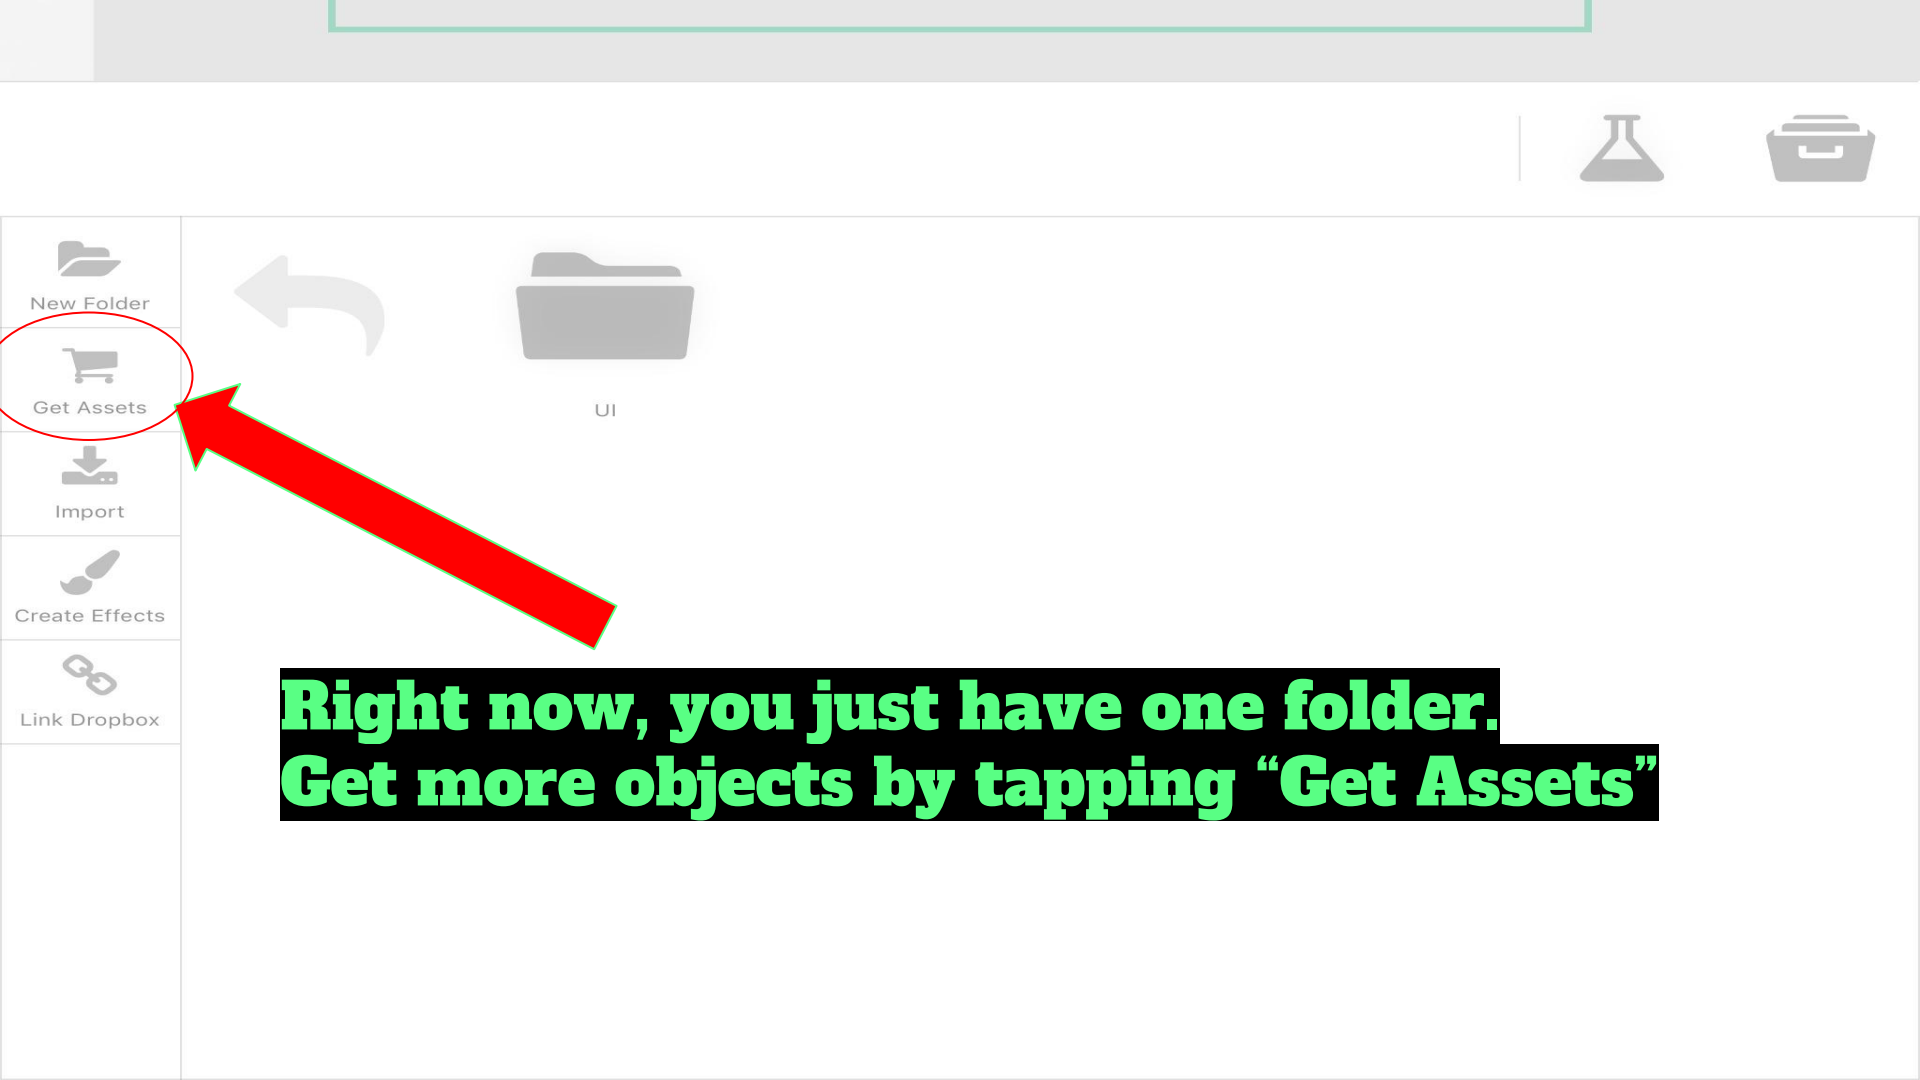

**The folder where you
get all of your objects
to place on the
surface**

Select this

How to get more objects

New Folder

Get Assets

Import

Create Effects

Link Dropbox

UI

**Right now, you just have one folder.
Get more objects by tapping “Get Assets”**

FEATURED ASSETS

- **Start off by selecting the “Platformer Starter Kit” --then tap “Get”**
- **You can always come back here and get more stuff**

Choosing a Background

● **After Downloaded “Platformer Starter Kit”...**

● **Tap the Background icon**

Scene Settings

Screen View

Background

Downloads

UI

Select, Downloads and choose what background you want under the “Backgrounds” folder

Level-Design

Placing objects on your game's surface

Level-Design

- ❖ Design your level by dragging and dropping object blocks (Grass Blocks, etc.) on the surface of your game
- ❖ You can start putting coins and obstacles
- ❖ Think about creating secret paths or traps

#Hint#

- When dragging & dropping blocks/objects, keep this grid tool selected
- This helps to keep everything aligned and snap together nicely

4:3

Making Your Character Move

Changing the Behaviours

- FIRST, make your character
 - a “**physics**” object
- Then, tap “**behaviors**”

Walk-14

Blue Alien

BEHAVIORS

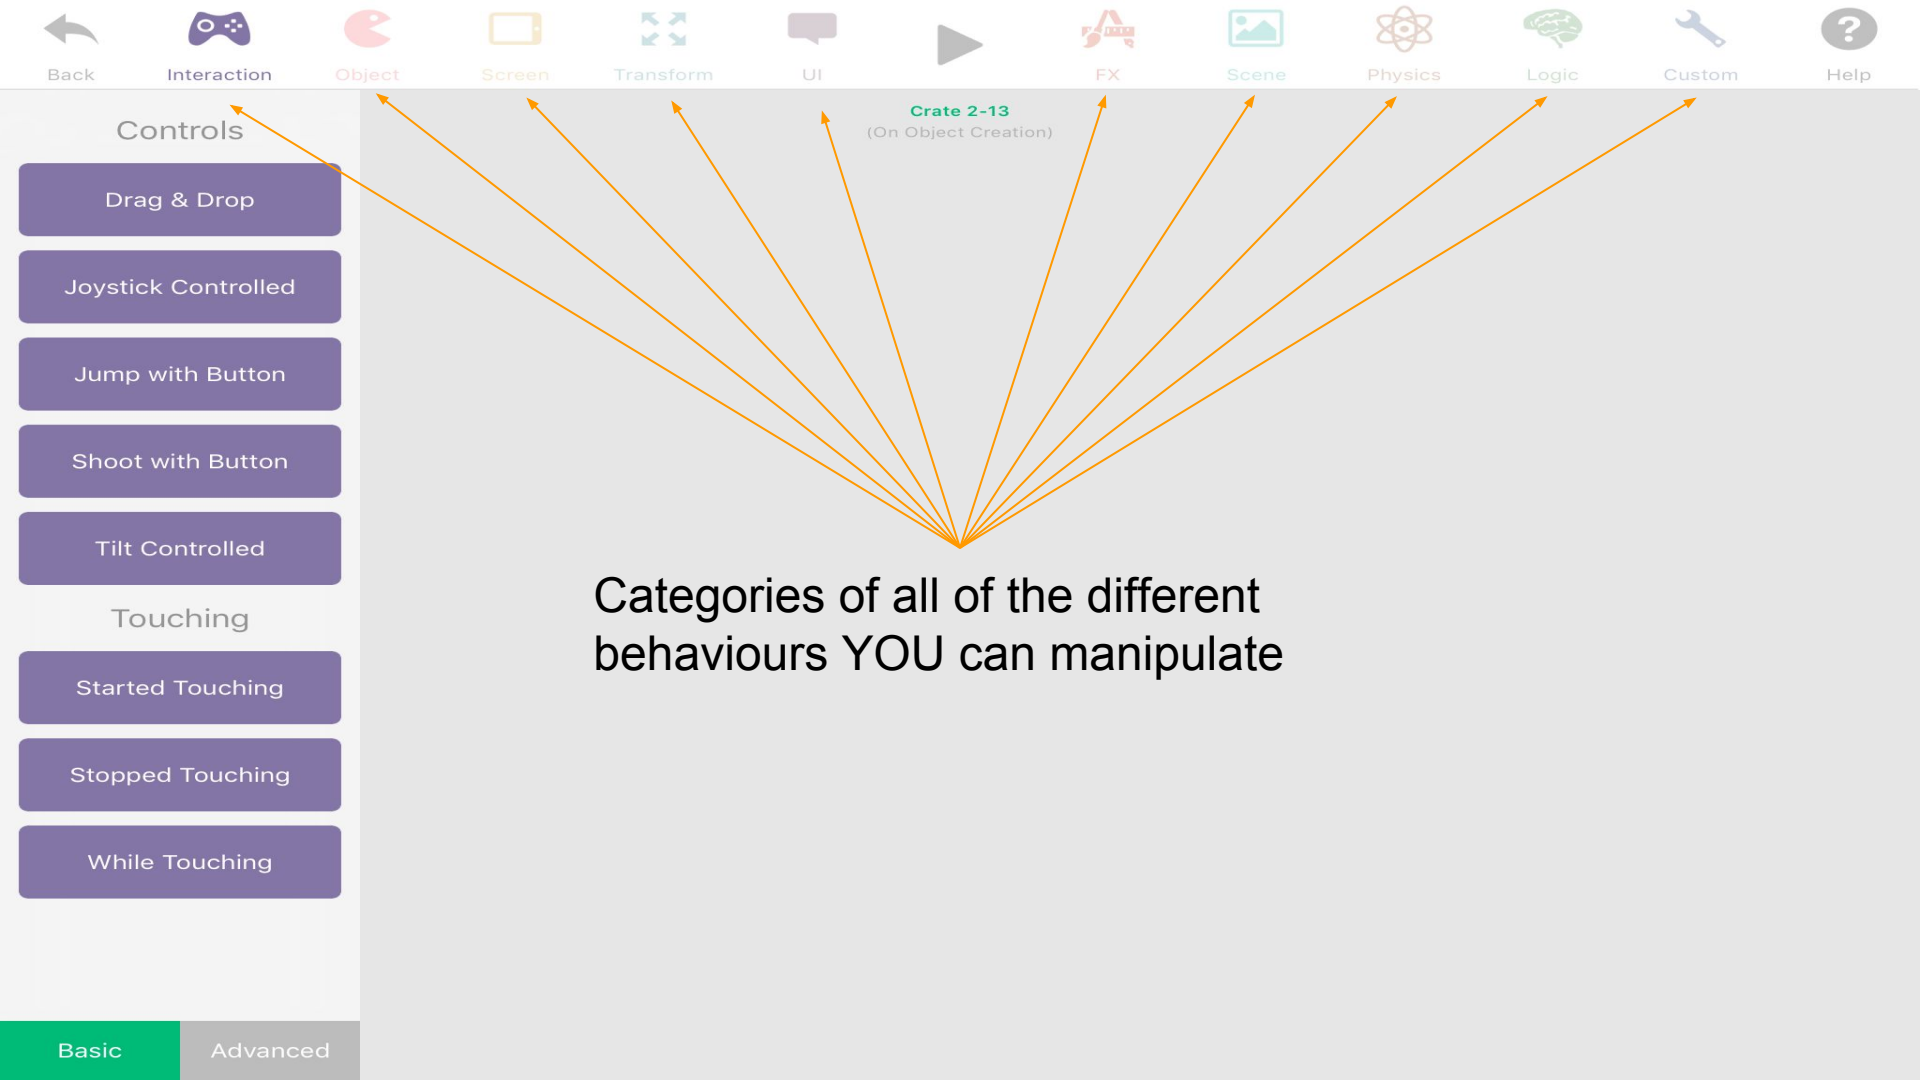

Passable: ☐

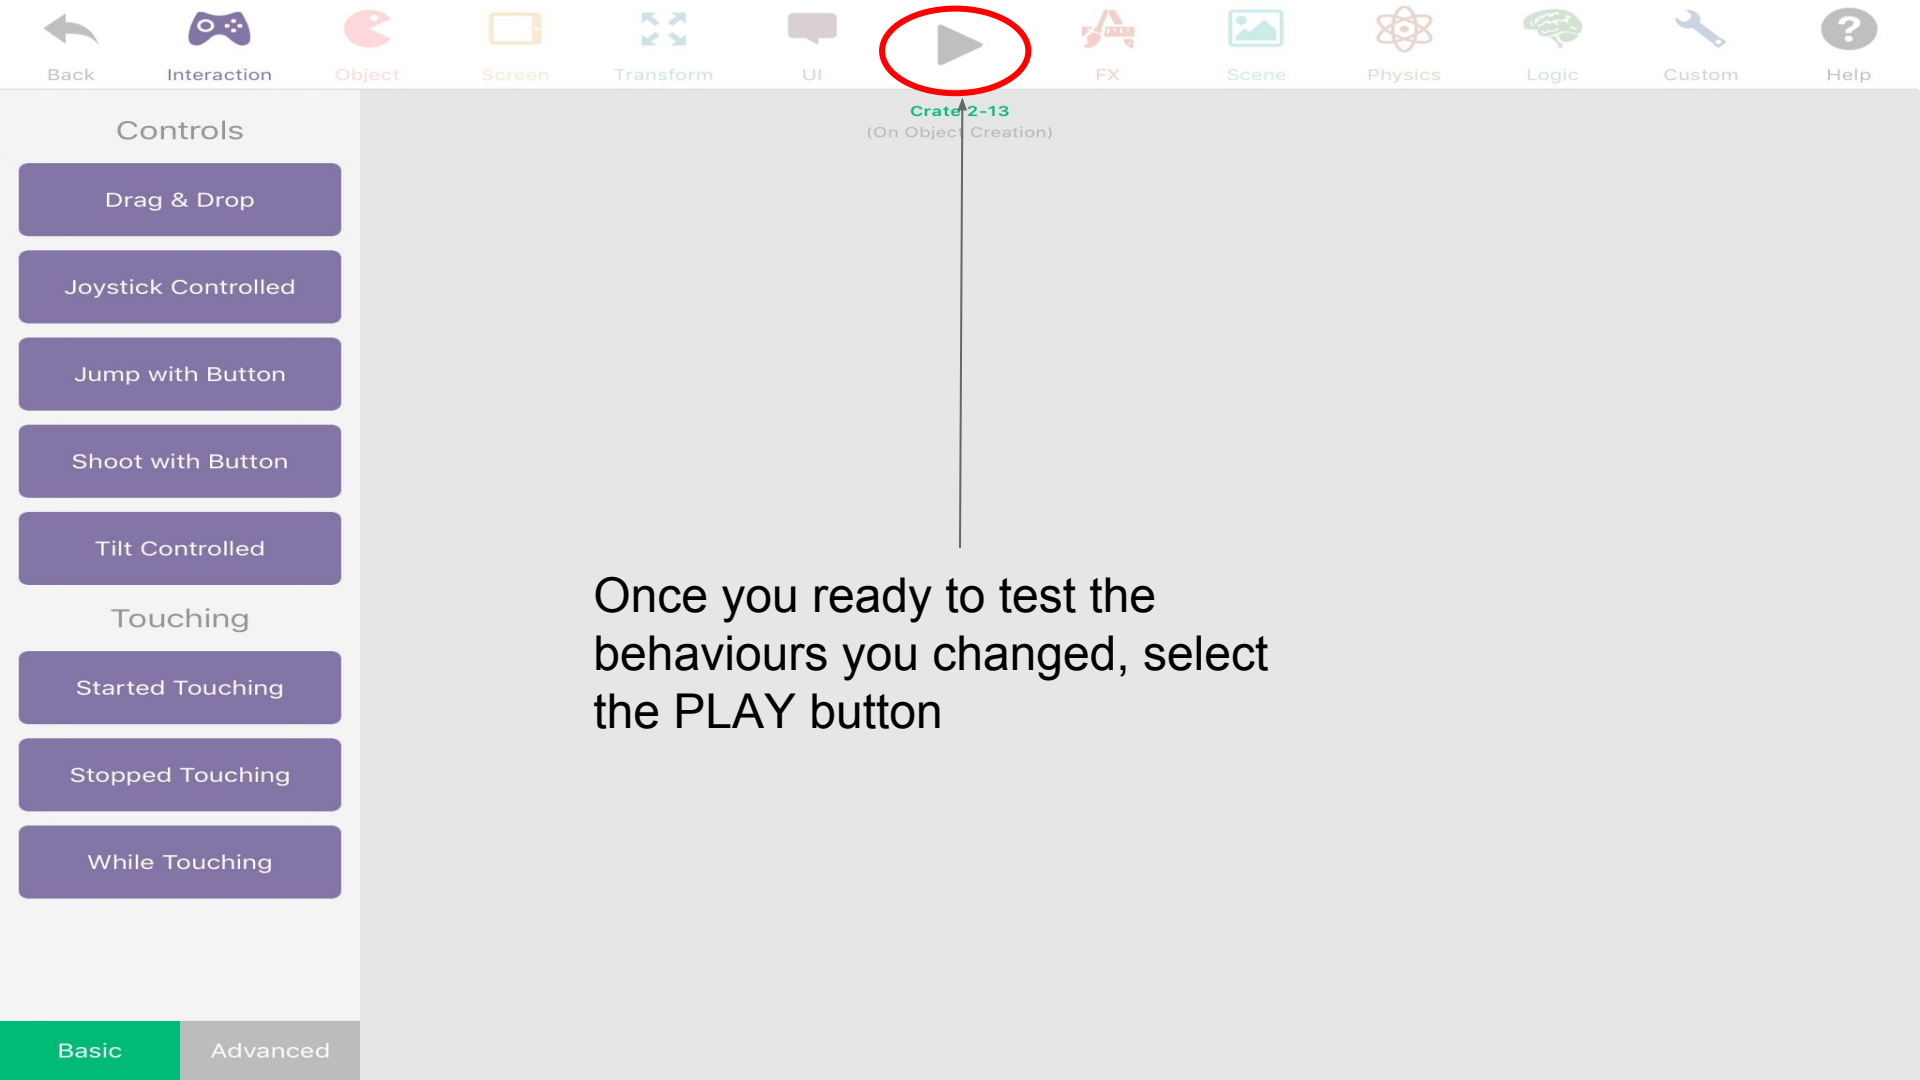

Friction: 35.00 %

Bounce: 0.00 %

Mass: 20.00 kg

Physics icon circled in red

Crate 2-13
(On Object Creation)

Once you ready to test the behaviours you changed, select the PLAY button

Jump

Walk

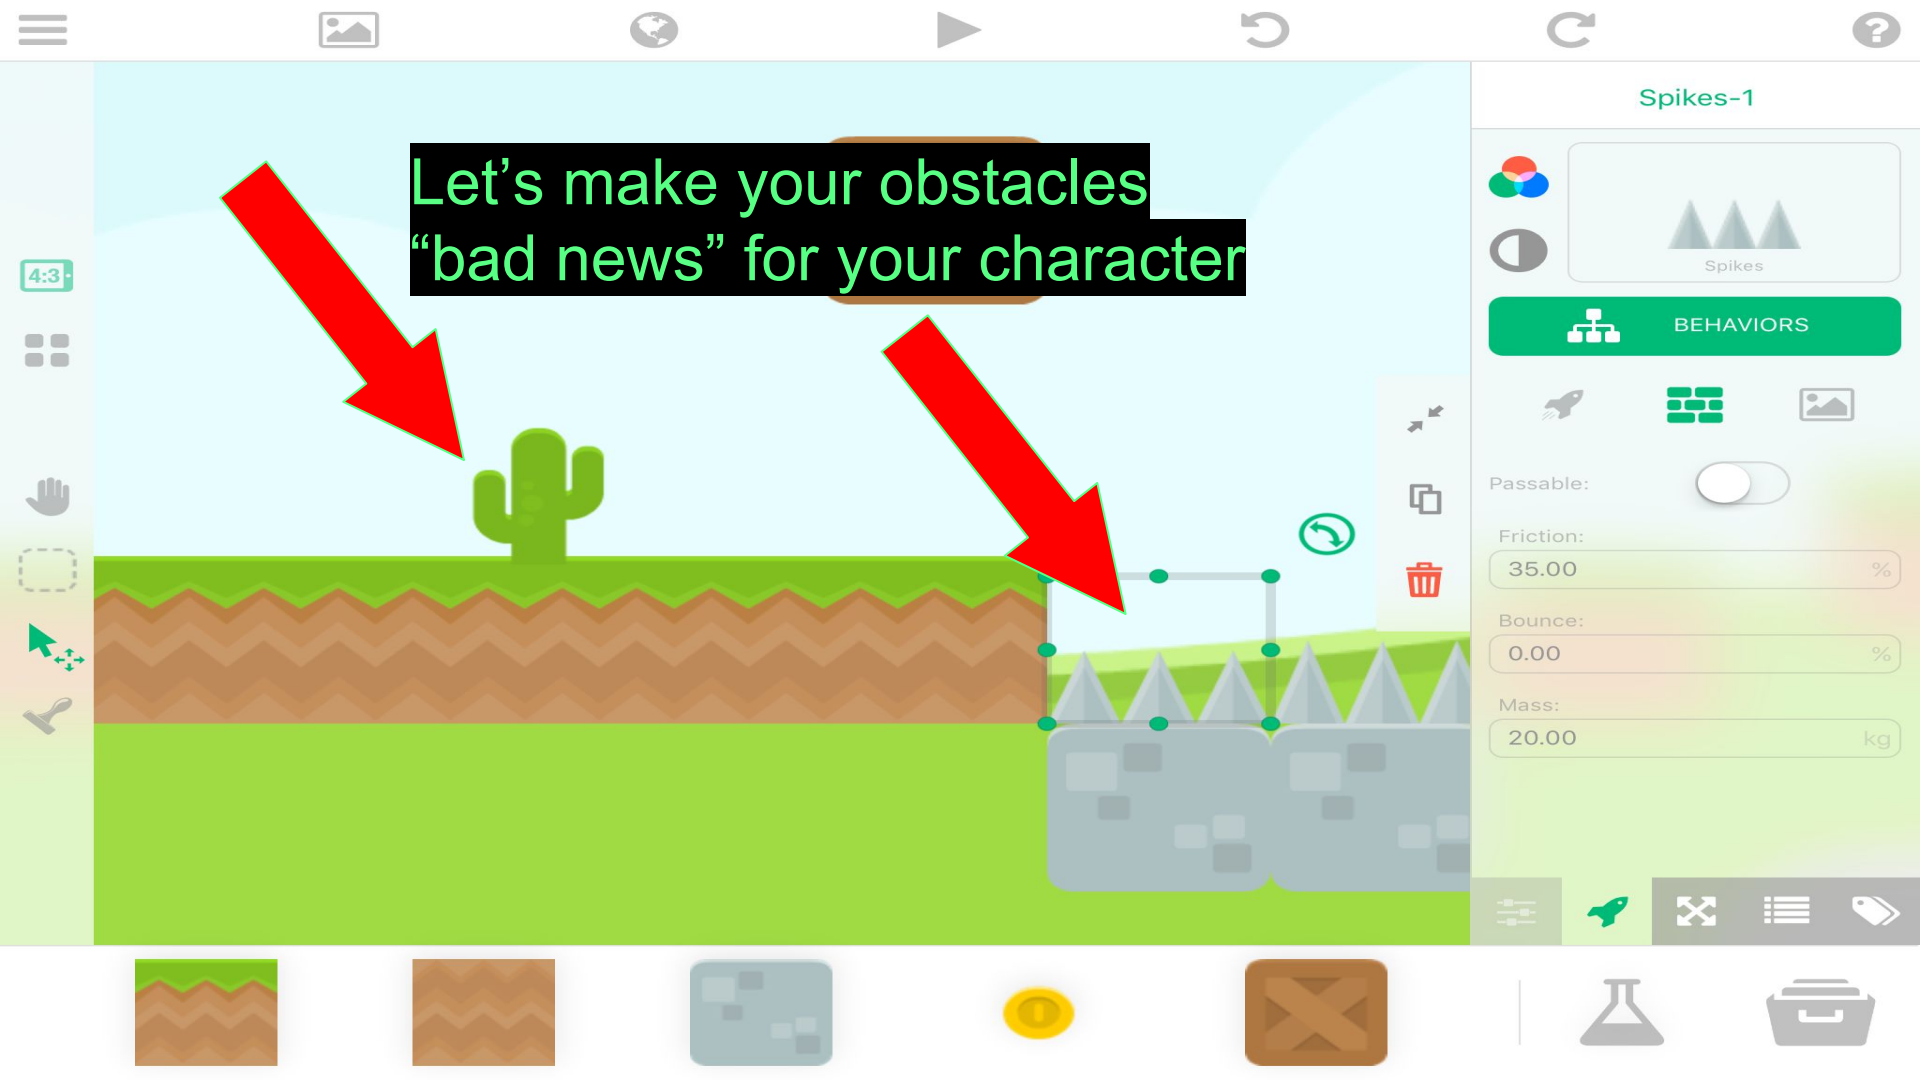

Screen Follow

- To have your character walk and jump smoothly, attach animation behaviours from the “FX” category
- These are also known as “sprites”

Obstacle Behavior

Changing the Behaviours to make objects behave like
obstacles

Let's make your obstacles
"bad news" for your character

Spikes-1

Spikes

BEHAVIORS

(On Object Creation)

CONDITIONS:

Once the spikes collide with the spaceguy...

Then, Game Over!

Collectable Behaviors

Changing the Behaviours of objects so the main character
'collects' them

Collectables Behaviours

- ❖ Setting up the behaviours for collectibles, like coins, gems, keys etc. is similar to obstacle behaviour
 - First, there is a collided behaviour
 - Second, something happens after that
 - For example,
 - When a character collides with a coin, the coin disappears
 - You can even add that to your character's score

Don't Reinvent the Wheel!!!

- When you run into a problem, think about if you have seen a similar problem before
- What did you do then?

Enemy Behaviors

Changing the Behaviours of more objects

Enemy Behaviours

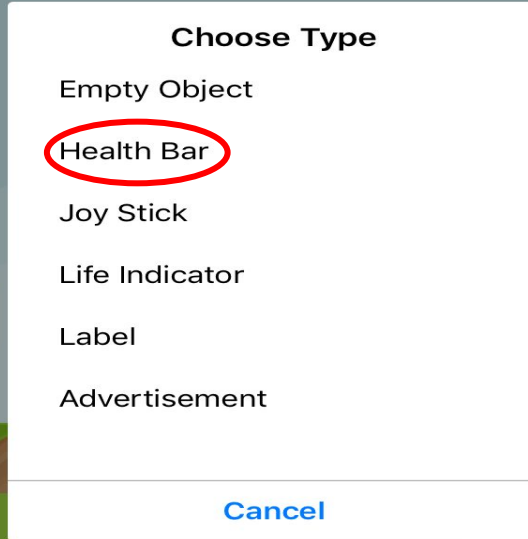

- ❖ Again, setting up the behaviours for enemies is similar to those for coins and obstacles
 - The main differences:
 - You can have the enemy move (“**patrol**”)
 - Once you collide with the enemy, your health bar can go down or it can be game over

Health Bar

Creating a working health bar for main character

1. Make sure you are in the "Global UI" layer
2. Select the "erlenmyer flask" at the bottom of the screen
3. Select the "Health Bar"

Make sure you switch back to the "Main Layer"
when you want to place more objects

Cactus-11
(On Object Creation)

Collided2

Add to Health Bar1

If2

Load Overlay2

Shake Screen

Here's how you would set up obstacles to hurt your character's health

Adding Points

Get points for collecting coins (and other collectibles)

1. Make sure you are in the "Global UI" layer
2. Select the "erlenmyer flask" at the bottom of the screen
3. Select the "Label"

Choose Type

Empty Object

Health Bar

Joy Stick

Life Indicator

Label

Advertisement

Cancel

Make sure you switch back to the "Main Layer"
when you want to place more objects

1. Change the label to say Points (or coins, etc.)
2. Change the Alignment

Helvetica-1

Helvetica

Helvetica

BEHAVIORS

Points

Size:

36 pt

Alignment:

Width:

110 pt

Height:

64 pt

Outline:

Make sure you switch back to the "Main Layer" when you want to place more objects

Then, Repeat

- Make One more Label
- This is the label that will change each time you collect things

1. Make sure you are in the "Global UI" layer
2. Select the "erlenmyer flask" at the bottom of the screen
3. Select the "Label" again

Choose Type

Empty Object

Health Bar

Joy Stick

Life Indicator

Label

Advertisement

Cancel

Make sure you switch back to the "Main Layer" when you want to place more objects

Name this label the number: zero
Line it up next the previous label: "Points"

Helvetica-11

Helvetica

BEHAVIORS

0

Size: 36

Alignment:

Width: 500 pt

Height: 64 pt

Outline:

Making the Points Label Add

Get points for collecting coins (and other collectibles)

Coin Gold-1
(On Object Creation)

Collided3

Destroy Object

Play Sound

Add to Score

Add to Score

(Add to Score)

0

Helvetica-11

Add By:

1

Infinite Score:

Event When Score Reaches:

1000

On

Choose the label to add to

Tap an object to select.
Drag the target to choose a position.

Points

0

For the coin's behaviours, be sure to select the
label that is names "0"
Also, be sure to be under the "Global UI" layer

Layers

Now Test it out!

You will now see your points add up when you collide with coins

Design Thinking Interview

Day 4
